

ABSTRACT

The present invention comprises apparatus, methods and articles of manufacture for providing, accessing and editing content intended for publication or dissemination. A client-server architecture is provided in the preferred embodiments which provides User Types (Internal Users and External Users) with various Content Types and Content Subtypes through various dissemination channels. The User Types provide, access and edit the Content Types. In the preferred embodiments, the Internal User User Type provides almost all the Content Types, with limited contributions by External User User Types. User Types comprise Content Providers, Content Reviewers, Editors, Approvers, and possibly others.
